M. Tatagiba, U. Ernemann, D. Bartz*

Universität Tübingen

# CT/MR Angiography

CT angiography (CTA) or magnetic resonance angiography (MRA) data conventionally used in **vascular surgical procedures**.

# 3D Rotational Angiography (3DRA)

# Motivation

- **CTA** and **MRA** provide a **context** anatomy (bones and tissue).
- **3DRA** provide a clear high resolution understanding of **vasculature**.
- ▶ *Registering 3DRA to CTA/MRA allows for high resolution vessel information to be put into the context anatomy.*

# MIR Tool

- **ITK** Segmentation and Registration Toolkit
- **FLTK** GUI Toolkit
- **Mutual Information** (MI) based image registration algorithm
- Optional **Moments** (automatic)/**Landmark** (user-driven) initialization step

# Results

- Due to relatively **high noise** level in **3DRA** images **landmark** initialized registration works best.
- For registration of **other modalities** (i.e. CT to MRI) **automatic rigid registration** with no initialization step is sufficient.

# Conclusions

- Developed a successful **multi-modal medical image registration framework** for the registration of angiography images.
- 3DRA to CT-/MR-A **combines detailed information of the vascular system with content information** about bone and tissue.
- **Protocol** at the hospital **adjusted** so **suitable dataset** combinations are more often **acquired** (typically CTA *and* 3DRA).
